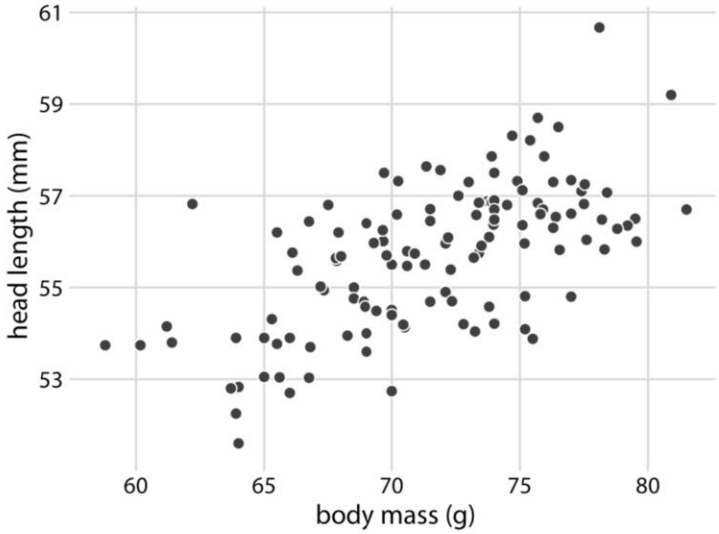
Visualizing Quantitative Associations

The **scatterplot** is perfect for examining the relationship between two quantitative variables.

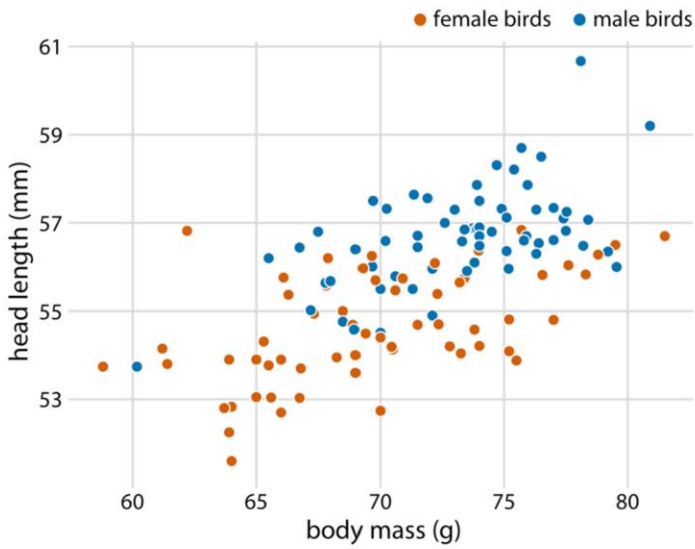
But many times we want to understand the relationship between a response variable and *many* different input variables or features.

An Example with Birds

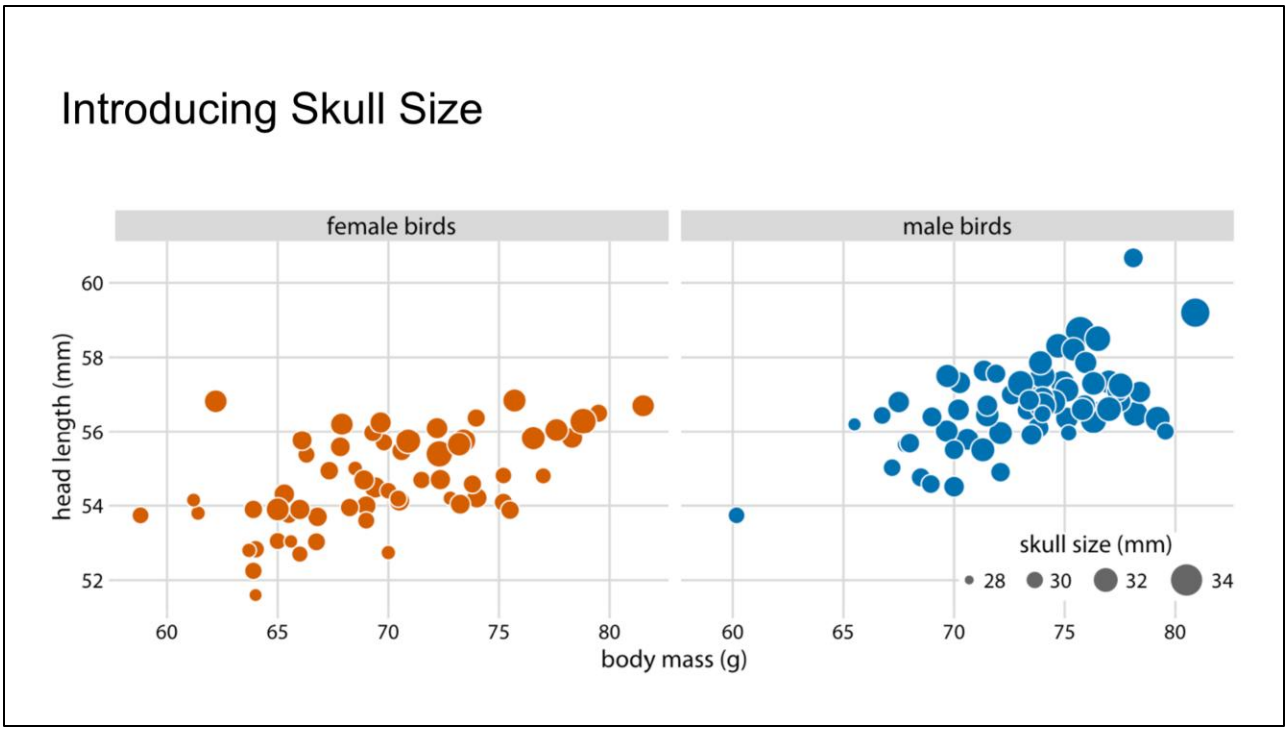


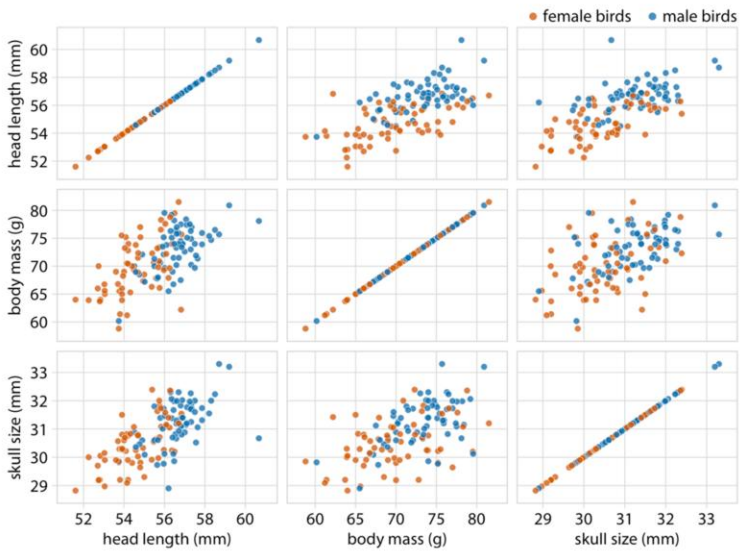
Scatter plot – shows cluster relationship between two features

Introducing Gender



- Multi plot
  - Differentiated with different mark shape and color
  - Show cluster relationship between the two based on same features



- Size circles show quantity differences of same data
    - Size of data represents how many duplicate datapoints in the dataset


All-Against-All Scatter Plot Matrix
