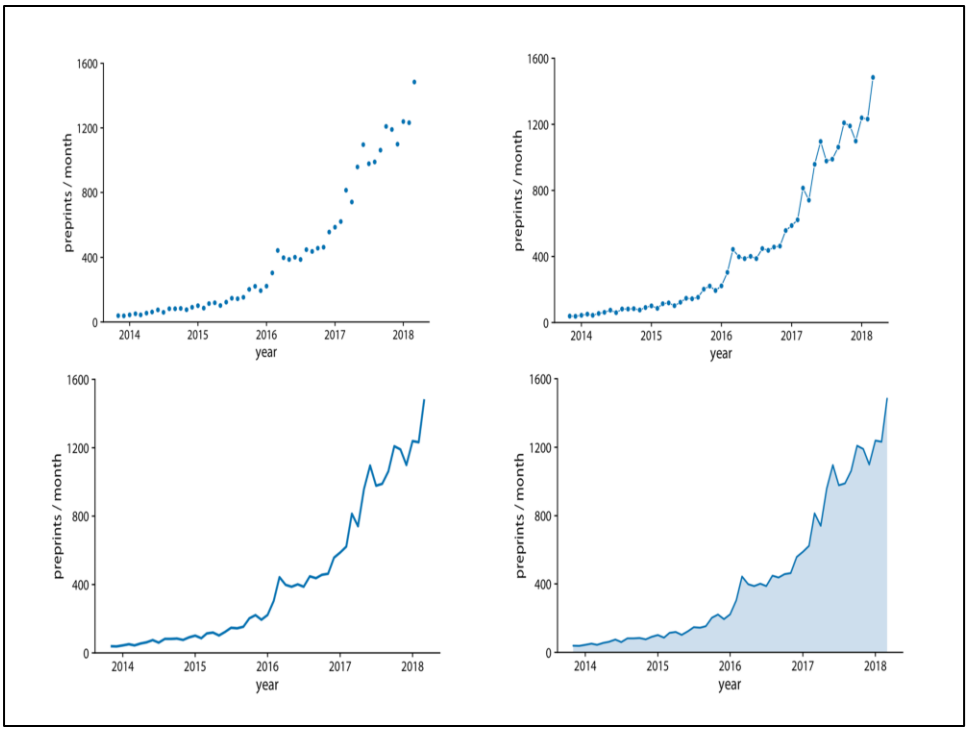
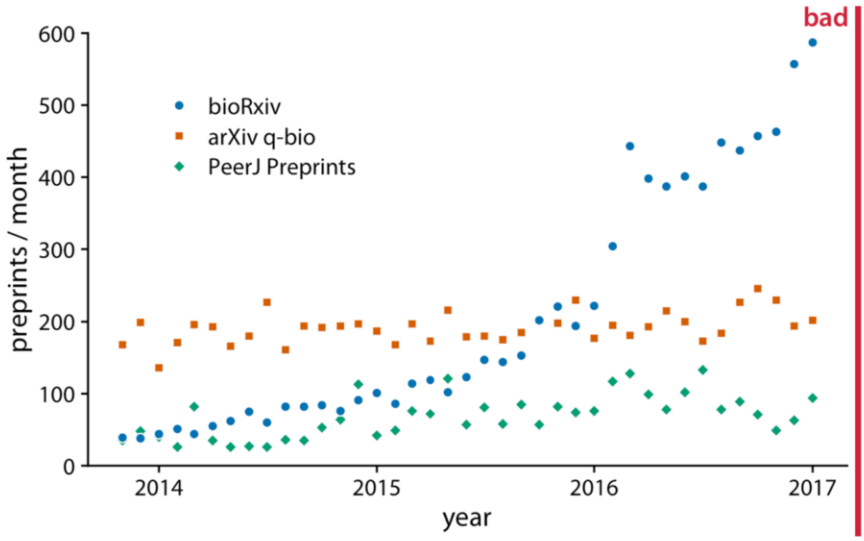
Line Plots - Single Time Series



- Line plot : two or more response variables
  - Each response would have their own graphs
    - Dues to variables are different and cannot be merged
    - If related vertically concat while sharing the same X axis if match

Line Plots - Multiple Time Series



- Scatterplot alone for multiple time series
    - Bad example as it is difficult to trace which is which series
    - Color code and point channels alone are not efficient
